

# View Controllers Testing

# Types Of Verifications

- Return Value Verification
- State Verification
- Behavior Verification

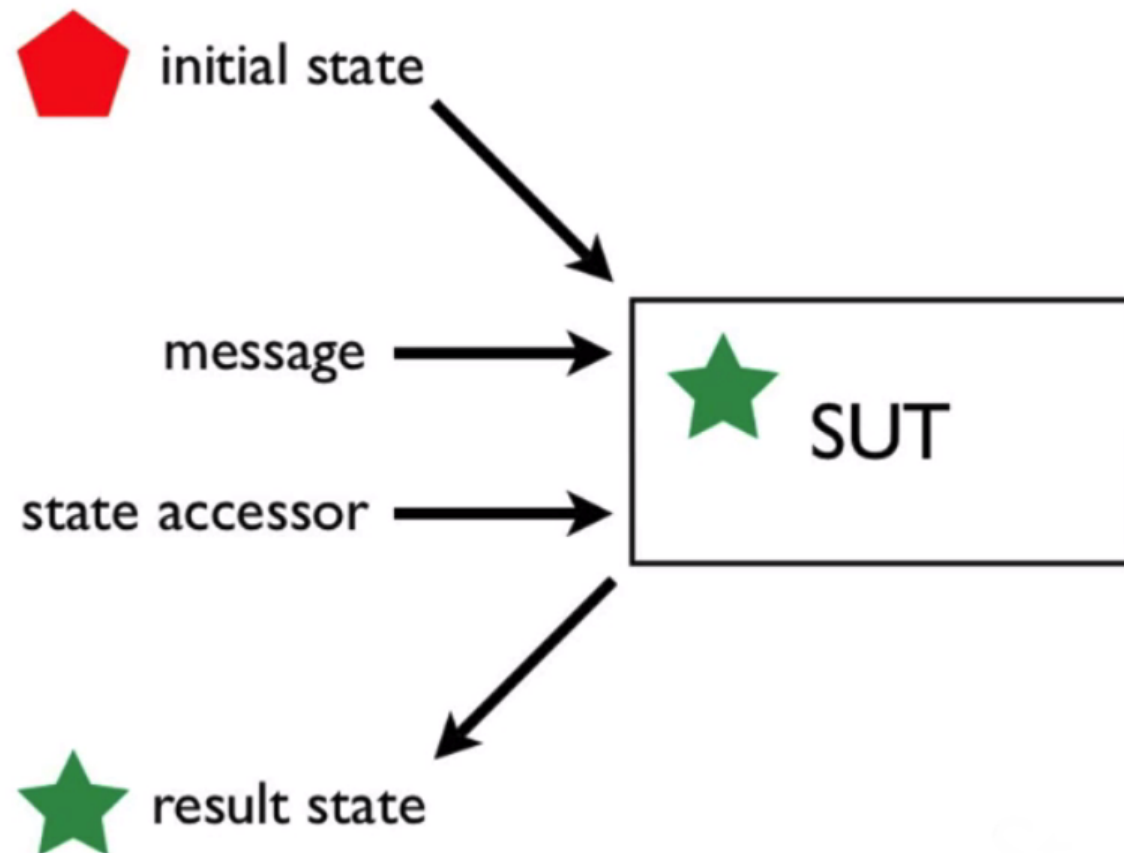

# Return Type Verification

- `(id) calculateSomethingFromArg: (id) arg;`

# State Verification

- (`void`) doSomething;

# Behavior Verification

# Behavior Verification

# Three Types Of Verifications

1. Return Value Verification

2. State Verification

3. Behavior Verification

# IBOutlet – IBAction Testing

```
@property (weak, nonatomic)
    IBOutlet UIButton *button;
```

```
- (IBAction)
    doSomething: (id) sender;
```

- Test #1: Is outlet hooked up?
- Test #2: Is outlet connected to action?
- Test #3: Invoke action directly.

# Hide Or Not To Hide?

- KVC;
- class extension in separate .h file;

# Hide Or Not To Hide?

- KVC;
- class extension in separate .h file;

I think that outlets and actions are public interface anyway. They're methods and properties that are used by other objects; the fact that those objects may be created in a non-code tool doesn't change that fact.
